Signed

Release 0.1

DD

Oct 03, 2021

CONTENTS

Signed is a twitter-like social network owned and controlled by its users. It uses the same cryptographic algorithms to sign messages as bitcoin uses to sign transactions. Because each message is signed by the source, the followers may verify the authenticity of the message regardless of how this message was delivered.

Check out the *FAQ* section for further information

Note: This project is under active development.

1.1 FAQ

This is a list of some questions we recently got. If you cannot find an answer for your questions here, you are welcome to post it on our

1.1.1 General questions

Who needs another social network?

Everybody who is frustrated by the censorship, surveillance and advertising from the big tech.

How signed is different?

- Signed is distributed - i.e. there's no central entity or owner that could control the network.
- Signed is open source
- Signed is essentialy a protocol (like HTTP) and a format (like HTML) enabling interoperation of

independent software components, rather than a monolithic product.
